

## **AMENDMENTS TO THE CLAIMS**

The following is a complete listing of revised claims with a status identifier in parenthesis.

### **LISTING OF CLAIMS**

1. (Currently Amended) A digital measuring head in a measuring apparatus which measures a work by making a contact element abut to the work, the digital measuring head comprising:

an arm supported rotatably around a support point arranged on a base;

a finger having the contact element at a tip end and mounted to a tip end portion of the arm; and

a scale and a read head, one of which is provided at a rear end portion of the arm and the other of which is arranged on the base, wherein

displacement of the contact element which contacts with the work is measured with the scale and the read head based on at least one of refraction and reflection of light by the scale.

2. (Canceled)

3. (Previously Presented) The digital measuring head of claim 1, wherein the readhead further includes,

an emitter adapted to emit light, and

a receiver adapted to receive at least one of reflected and refracted light.

4. (Currently Amended) The digital measuring head of claim 1, wherein the scale ~~is adapted to reflect~~s or refracts light emitted by the readhead.

5. (Previously Presented) The digital measuring head of claim 1, further comprising

a pressurizing member, and

a damper, wherein

the pressurizing member is adapted to keep the contact element in continuous contact with the work and the damper is adapted to reduce unwanted oscillations of the arm.

6. (Currently Amended) A digital measuring apparatus comprising:  
a control unit;  
an analog to digital converter;  
an arm rotatably supported around a support point arranged on a base;  
a finger, including a contact element mounted to an end portion of the arm; and

a scale and a read head, at least one of which is provided at a rear end portion of the arm and the other of which is arranged on the base; wherein

displacement of the contact element which contacts with a work is measured with the scale and the read head based on at least one of refraction and reflection of light by the scale.

7. (Canceled)

8. (Previously Presented) The digital measuring apparatus of claim 6, wherein the readhead further includes,

an emitter adapted to emit light, and

a receiver adapted to receive at least one of reflected and refracted light.

9. (Currently Amended) The digital measuring head of claim 7, wherein the scale ~~is adapted to reflect~~s or refracts light emitted by the readhead.

10. (Previously Presented) The digital measuring head of claim 6, further comprising

a pressurizing member, and

a damper, wherein

the pressurizing member is adapted to keep the contact element in continuous contact with the work and the damper is adapted to damp the jump of the contact element.

11. (Previously Presented) The digital measuring head of claim 9, wherein the damper is a dash pot type damper,

12. (Currently Amended) A digital measuring head comprising:  
at least one arm rotatably supported around at least one support point arranged on a base;  
at least one finger including at least one contact element mounted to an end portion of the at least one arm; and  
at least one scale and at least one read head adapted to measure at least one displacement of the at least one contact element based on at least one of refraction and reflection of light by the scale.

13. (Previously Presented) The digital measuring head of claim 12, wherein

the at least one arm further comprises a first arm and a second arm rotatably supported on a first support point and a second support point, respectively, and

the at least one finger further comprises a first finger, including a first contact element, arranged at the end portion of the first arm and a second finger, including a second contact element, arranged at the end portion of the second arm.

14. (Previously Presented) The digital measuring head of claim 12, wherein the at least one scale and the at least one read head further comprises,

a first scale and a first read head adapted to measure a first displacement, and

a second scale and a second read head adapted to measure a second displacement.

15. (Canceled)

16. (Previously Presented) The digital measuring head of claim 12, wherein the at least one readhead further includes,

at least one emitter adapted to emit light, and

at least one receiver adapted to receive at least one of reflected and refracted light.

17. (Currently Amended) The digital measuring head of claim 12, wherein the at least one scale ~~is adapted to reflect~~ or refracts light emitted by the readhead.

18. (Previously Presented) The digital measuring head of claim 12, further including, at least one pressurizing member and at least one damper.

19. (Currently Amended)      A digital measuring device comprising:  
  
a read head adapted to generate signals and receive reflected signals;  
  
and  
  
a scale adapted to reflect generated signals; wherein  
  
\_\_\_\_\_one of the scale and the read head is stationary and the other is  
  
movable, and wherein  
  
the device is adapted to measure a displacement of a contact  
  
element based on the generated signals reflected by the scale.

20. (Previously Presented)      The digital measuring device of claim 12,  
  
wherein the signals are light signals.
